## 2. Empathy Map

## 2. Empathy Map

### 2.1 Persona

**Name:** Ravi Kumar

**Age:** 27

**Occupation:** Employee at a private company

**Goal:** Get to the office on time each day by metro, without losing time at the ticket counter.

### 2.2 Empathy Map Canvas

| Quadrant | Observations                                                                                                                                                                                                                                                                                                                                                      |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAYS     | "Why is this line so long every single morning?" "I never seem to have exact change for the token machine." "I wish booking a ticket was as easy as booking a cab from my phone." "This queue is going to make me late for my meeting."                                                                                                                           |
| THINKS   | "Surely there is a simpler way to handle this by now." "I wish I knew the fare before I even got to the station." "I hope the app holds up right when I need it." "Will my ticket still scan if the station's network is slow?"                                                                                                                                   |
| DOES     | Arrives at the station 10–15 minutes ahead of schedule to allow for queueing. Waits in line behind fellow commuters. Searches for cash or a card at the counter. Checks the fare chart on the wall by hand. Holds on to the paper ticket carefully until reaching the exit gate. On occasion skips the metro during rush hour altogether and books a cab instead. |
| FEELS    | Rushed and impatient during peak travel windows. Worried about missing the train. Relieved on the days the queue is short. Annoyed when the token machine is out of service. Would feel assured and in control if the whole process could be wrapped up instantly from a phone.                                                                                   |

### 2.3 Pains

- 5 to 15 minutes lost every day standing in line — which adds up considerably across a month.
- The chance of missing a train because counter processing is slow.
- Tokens that get lost, dropped, or forgotten, forcing a repeat purchase.
- No way to check fare, route, or expected journey time before reaching the station.
- A weaker experience for first-time riders, tourists, senior citizens, and differently-abled commuters, who often need extra help that counters can't reliably offer.

### 2.4 Gains (What Success Looks Like)

- Being able to complete a booking in under a minute, from anywhere, before even reaching the station.
- A fare that is calculated instantly, accurately, and without manual error.
- A digital QR ticket that can be scanned straight at the gate, removing the need for a physical token.
- An automatic confirmation notification that offers peace of mind.
- A dependable, accessible experience for every kind of commuter, including elderly and differently-abled passengers.
- Less crowding at stations, making travel smoother for everyone involved.

### 2.5 Insight Summary

What stands out from the empathy map is that commuters' main frustration is the time wasted on manual, in-person steps, along with not knowing the fare or queue length ahead of time. What they want is an obviously faster, self-service, mobile-first way to book and pay for a ticket before ever arriving at the station. This is exactly what a ServiceNow Service Catalog-based booking flow can deliver — automating the fare calculation and issuing an instant QR-code ticket, taking the counter out of the equation altogether.
