

Smart Metro Ticket Booking System

Project Design Phase

Date	
Team ID	
Project Name	Smart Metro Ticket Booking System
Maximum Marks	4 Marks

1. Solution Architecture

This document walks through the end-to-end architecture of the Smart Metro Ticket Booking solution on the Now Platform — how the four personas interact with the presentation layer, how requests move through application logic and integrations, and how data and security controls run underneath every layer.

1.1 Architecture Overview

Security & Admin: ACLs | OAuth 2.0 | Data Encryption | Role-based Access (spans all layers)

Figure — End-to-end solution architecture on the Now Platform

Passengers, Station Managers, Metro Operations, and IT Admins all reach the system through the same Service Portal / UI Pages layer, so the front end stays unified across personas. Requests are handled by the application layer — the Service Catalog for input capture, Flow Designer for workflow orchestration, and Business Rules / Script Includes for fare logic — before being routed through the Integration Hub to external systems: the payment gateway, the QR code generation library, and the notification channel. All reference and transactional data lives in the data layer, and Performance Analytics turns that data into operational dashboards. Access Control Lists, OAuth 2.0, and data encryption run across every layer to keep the platform secure by design.

1.2 Component Responsibilities

Layer	Key Components	Responsibility
Presentation Layer	Service Portal, UI Pages, WhatsApp Chatbot	A single front door for all four personas across web, mobile, and chat.
Application Layer	Service Catalog, Flow Designer, Business Rules, Script Includes	Captures booking input and runs fare and workflow logic server-side.
Integration Layer	Integration Hub, REST/SOAP Spokes	Routes calls to payment, QR, and notification systems with logging and retries.
Data Layer	Station Master, Fare Rule Table, Ticket/QR Records, Transaction Logs	The single source of truth for reference and transactional data.

Layer	Key Components	Responsibility
Reporting Layer	Performance Analytics, Reports, Dashboards	Turns stored data into usage, revenue, and peak-time insight.
Security Layer	ACLs, OAuth 2.0, Data Encryption	Enforces role-based access and protects payment and QR data end-to-end.

1.3 Design Principles

- Single platform: every persona is served from one centrally administered Now Platform instance.
- Low-code first: Flow Designer, Business Rules, and the Service Catalog are favored over custom scripting wherever possible.
- Traceability by default: every booking, payment, and QR event is logged with a correlation ID.
- Security by design: ACLs and encryption are applied consistently across presentation, application, and data layers rather than added on afterward.
- Loose coupling to external systems: the Integration Hub shields the core platform from changes made by the payment gateway or QR provider.
